Subject:

Elite ETS Mid And Rear Steer Axle Hub Bolts. New Torque Value

Following a review of their service literature, the supplier of the ETS mid and rear steer axle have changed their recommended torque value of the hub bolts (10 per side) from 180Nm plus 60° rotational angle to 500Nm.

Dennis Eagle recommend that on the vehicles next planned inspection, the hub bolts are physically torqued to the new value of 500Nm and the bolt security is then checked and maintained on the vehicles six weekly safety checks.
